

Daily Task Report – Task 10

Data Analytics Track | Simple KPI Tracking Sheet | 17 September 2026

1. Task Objective

The objective of Task 10 was to build a one-page KPI summary from raw order data. The dashboard should present key business metrics such as revenue, units sold, average sales per order record, and the top-performing sub-category, with formulas that update when new rows are added to the source table.

2. Tools Used

- Microsoft Excel / WPS Spreadsheet
- Excel Table with structured references
- Pivot Table
- Google Sheets concepts for spreadsheet-based analysis

3. Work Completed

- Reviewed the provided Superstore raw dataset.
- Converted/used the source data as a structured table named SuperstoreData.
- Calculated total revenue using the Sales field.
- Calculated total units sold using the Quantity field.
- Calculated average sales per order record.
- Created a Pivot Table summarizing Sales by Sub-Category.
- Identified Phones as the highest-sales sub-category.
- Created a one-page KPI Summary sheet containing the final metrics.
- Applied appropriate currency and number formatting.
- Used structured table references so KPI calculations can include additional rows added to the Excel Table.

4. KPI Results

KPI	Result
Revenue	\$2,297,200.86
Units Sold	37,873
Average Sales per Order Record	\$229.86
Top Sub-Category	Phones

5. Pivot Table Analysis

A Pivot Table was created with Sub-Category as the row field and Sum of Sales as the value field. The Pivot Table shows Phones at the top based on total sales, followed by Chairs, Storage, Tables, Binders, Machines, Accessories and other sub-categories. The grand total of sales is \$2,297,200.86.

6. Key Learning Outcomes

- Learned how to convert raw transactional data into business-ready KPIs.

- Practiced SUM and AVERAGE calculations using structured table references.
- Learned how Pivot Tables can summarize large datasets by category.
- Improved understanding of KPI selection and concise dashboard presentation.
- Practiced consistent formatting for currency and numeric business metrics.

7. Validation Notes

The final KPI sheet was checked against the Pivot Table and source data shown during the task. The top result is reported as a sub-category because the available field used for the Pivot Table is Sub-Category. The Pivot Table may need to be refreshed after new rows are added, depending on the configured source range.

8. GitHub Repository README Content

Simple KPI Tracking Sheet – Task 10

Overview

A one-page Excel KPI summary created from Superstore transactional data.

Objective

Transform raw order data into business-ready KPIs and summarize sales performance using Excel formulas and a Pivot Table.

KPIs

- Revenue: \$2,297,200.86
- Units Sold: 37,873
- Average Sales per Order Record: \$229.86
- Top Sub-Category: Phones

Tools

- Microsoft Excel / WPS Spreadsheet
- Excel Tables
- Structured References
- Pivot Tables

Key Features

- KPI summary sheet
- Automated calculations using structured references
- Sales analysis by sub-category
- Currency and number formatting
- Pivot Table for identifying the highest-sales sub-category

Files

- Raw Data – source Superstore dataset
- Pivot Table – sales by sub-category
- KPI Summary – final one-page KPI dashboard

Learning Outcome

This task strengthened practical skills in spreadsheet-based data analysis, KPI calculation, Pivot Tables, and business reporting.

9. LinkedIn Post Draft

Completed Task 10 of my Data Analytics internship! ■

Today I worked on building a Simple KPI Tracking Sheet using a Superstore dataset.

■ Calculated key business KPIs:

- Revenue: \$2,297,200.86
- Units Sold: 37,873
- Average Sales per Order Record: \$229.86
- Top Sub-Category: Phones

■ Created a Pivot Table to analyze sales by sub-category.

■ Built a one-page KPI summary.

■ Used Excel structured references for dynamic calculations.

■ Practiced turning raw transactional data into clear, business-ready insights.

This task helped me strengthen my practical skills in Excel, data analysis, KPI reporting, and business-oriented thinking.

10. Conclusion

Task 10 was completed by transforming the Superstore raw data into a concise KPI report and supporting Pivot Table analysis. The final workbook demonstrates practical spreadsheet-based data analysis and reporting skills.
